

As 1100 standard

Continue

This page will describe to you a number of the drawing standards that will be required when completing your drawings in Industrial Technology - Graphics. Arrowheads shall be well defined. They may be open or solid and should comply with the forms and proportions. The length should be from 3 mm to 5 mm Lines: There are a number of different lines that you will be required to use in Technical Drawing. The table below shows you the different lines, describes where they are used and give you an example of each line. Type of Line: Use of line in Technical Drawing: Example of lines: Type A - Continuous, Thick Visible outlines of the drawing. Type B - Continuous, Thin Dimension and projection lines, leaders. Hatching on sections. Type C - Continuous, Thin (freehand) Break in the object. Type D - Continuous, Thin (ruled with zig-zag) Break in the object (Straight) Type E - Dashed, Thick Hidden edges. Type G - Chain, Thin Center Lines of circles, arcs and center of objects. Type H - Chain, Thick at each end and thin in the middle. Cutting plane in sectioning of objects. Where two or more lines of different type coincide, the following order of priority should be observed: (a) Visible outlines and edges, (b) Hidden outlines and edges, (c) Cutting planes, (d) Centre-lines, (e) Projection lines. Views: Selection of views shall be selected according to the following principles: (a) To reduce the number of views required to fully delineate the information to be specified, (b) To avoid the need for hidden outlines, (c) To avoid unnecessary repetition of detail. Sectioned views: Sectioning is used to show internal detail or to reduce the use of hidden detail lines that may make the object difficult to recognise. All hidden outlines in the section should be omitted except in special cases. These types of drawings are Orthogonal's with imaginary lines cutting the object into parts. Each sectional view or section shall be identified with its appropriate cutting plane, where identified, by inscribing a subtitle below the view or section; e.g. 'SECTION A-A', 'SECTION B-B'. Cutting planes are to shown using a "Type H" line with the direction of viewing show by an arrowhead and a letter placed at the tail of the arrow. The cutting plane should pass through the main part of the object. Hatching: The cut part of the object is to be shown using with a hatched line (usually at 45°, unless this would make the object more difficult to understand). Where two or more adjacent parts have been sectioned the hatch line should be at different angles. Angle of Hatching Sectioning of Adjacent components Where an object is symmetrical a part section can be used to assist in the clarity of the drawing. If the object has a web support and the section plane passes along this then the web is not sectioned, although if the section plan passes through it then the web is sectioned (See image below). Note: In section A-A passes along the web and therefore is not hatched in the side view, although in section B-B the plane passes through the web and is shown in the bottom view. Breaks: Break maybe used to shorten lone objects and will use Type C or Type D lines. Symbols: The following symbols are to be used in dimensioning: Symbol: Use: Diameter symbol, this is used to indicate the diameter of a circle. R Radius Symbol, this is used to indicate the radius of a circle or arc. This symbol is used to refer to the object being identified is square and the same size across all surfaces. Dimensioning, Projection and Leader Lines: Objects that are drawn in Graphics often need to have dimensions showing the size and angles used to show detail about the component. Dimensions show the length and angle of items and the drawing should include only the measurements require to describe the object. Projection lines are lines that extend from the object and extend outside the outline of the drawing where possible. These lines should start and extend past the dimension line. Dimension Lines are to be Type B lines and should be draw parallel to the direction of measurement and where possible placed outside the outline of the object. The first measurement should not be closer then 30mm from the outline of the object, each subsequent measurement should not be closer then 20mm from previous dimension line. Dimension lines can be broken by the number although the style used must be consistent for the entire drawing. The image below describes how screw thread needs be show in a drawing. Find sources: "AS 1100" - news - newspapers - books - scholar - JSTOR (September 2017) (Learn how and when to remove this template message) AS 1100 is an Australian Standard for technical drawing including both mechanical and architectural designs. AS 1100 standard drawings contain attributes that are universal around Australia. The standard is published by Standards Australia. The standard consists of five parts, Part 101: General principles (1992)[1] Part 201: Mechanical engineering drawing (1992) Part 301: Architectural drawing (2008) Part 401: Engineering survey and engineering survey design drawing (1984) Part 501: Structural engineering drawing (2002) References ^ bare URL PDF This architecture-related article is a stub. You can help Wikipedia by expanding it. Retrieved from " This topic covers orthogonal drawing techniques and drawing standard. Particular attention is given to examples of dimensioned assembly drawings and methods of representing threads and threaded components. Key Concepts Orthogonals The purpose of assembly drawings The types of assembly drawings Visualizing the shape and proportions of an object when viewing assembly drawings The ability to make a freehand sketch of an object using a pictorial to accurate scaled size and dimension Apply AS1100 drawing standards Threads The AS1100 rules that apply with screw thread representation Representing a threaded rod/bolt Representing a threaded hole/nut Sectioning threaded components Discussion Questions Orthogonals Describe the purpose of an assembly drawing. Name examples of where assembly drawings are likely to be used. Can assembly drawings be either orthogonal or pictorial? Do the rules of projection apply with assembly drawings? Threads Why are threads represented rather than drawn exactly as they appear? Discuss the use of 'line types' to represent features of a V thread Discuss terms used for parts of a thread: thread depth pitch V and Square M for Metric How is the length of a bolt determined? How is a hexagon drawn? What is measured to determine the diameter of a bolt? What size are washers? What is a run-out? What s a tap and die? How is a thread correctly labelled using AS1100 standards? Do you section threaded parts? Assembly Drawing - Graphical Communication.com - YouTube Australian standards for engineering and technical drawing. Identified as Australian Standard AS 1100, the standards include a number of parts that describe the conventions for Australian engineers, designers, architects and associated tradespeople such as builders and plumbers to follow. AS 1100 incorporates general principles for technical drawing, including dimensioning, types of lines and layouts to use, scales, symbols, abbreviations and their meanings. It also includes mechanical engineering drawing, including information for surface texture, welding, centre holes, gears, etc. Please note that this standard is to be Proposed for Withdrawal on 15/10/2021 with public/stakeholder consultation period ending 17/12/2021. Please click here for further details and to provide feedback on this proposal. Sets out recommendations for the preparation of plans for architectural work. The first two sections, taken with Part 101 of NZS/AS 1100, provide a common method for representation of buildings and building components. Section 3 deals with levels and gradients, and Section 4 with conventions for doors, windows and miscellaneous other features. Section 5 gives recommendations for the representation of materials by colouring and hatching. Appendices give further information on cross-referencing, dimensioning by coordinates and the use of grids.
